Reflection for CS 5008 Week 2 Recitation

I thought this was a spectacular project to first get started with Java. The biggest problem that I had when completing this project was the testing. More specifically, I had trouble with the dependencies and making sure that the correct packages were installed on my machine. I learned a lot in this project, but for the most part I feel as if I have a much better understanding of the basic layout of Java and how it works. I don't believe there was anything that I was able to solve a problem to that I didn't understand. If anything, I was writing a unit test for the amount of money received, and I had an assert equal function checking to make sure that the value was \$800. It turns out that this failed, even though the expected and actual were absolutely identical. There was no whitespace. I also messed around to see if there was an issue with the type, because maybe one was a string and the other was an integer. That didn't seem to be the case. I finally deleted that test and did another one. At this point in time, one question I have is how this will all tie in to a GUI.
