Lab 8 Reflection

In this project, I really had no idea how you could calculate the distance between two points using latitude and longitude. This is super interesting, especially since the earth is curved. The MVC design completely changed my approach. Rather than worrying about what is inheriting what and what should be a separate file and what shouldn't, my overall approach was to think about what part of the program am I writing right now. Am I writing something that will be presented to the user or is this backend logic that is used to manage data in some way. I like this approach much better. It makes things much neater and easier to read and manage. I think MVC would be a good approach especially as things scale. It would probably lead to more spaghetti code but I would honestly prefer spaghetti code over a million different files. I don't have any questions about MVC.
